

- Land/Marine/VSP Technical Audits
- Tender Appraisal
- Instrument/Source/Receiver test analysis
- Pre-qualification and contract assessment
- Investigation of acquisition anomalies
- Long-term instrumentation monitoring
- Trained team of expert engineers

Technical Consultancy

Fast resolution of technical issues

Verif-i is the leading seismic instrumentation consultancy. Whether on a full field crew or vessel technical audit or advising on equipment suitability in a bid, our experienced engineers quickly identify the issues and make the appropriate recommendations.

Verif-i Technical Audits give you the reliable independent benchmark to ensure consistently high quality data in the field. Extensive experience shows that we can expect a third of the audits we undertake to reveal problems that would seriously impair the data.

Using our expert engineers means that any deficiencies with equipment or procedures are rapidly identified. The fast location of problem areas enables an efficient audit, reducing seismic acquisition time delays that can be costly and inconvenient. We also give advice on long-term procedures to prevent problems recurring.

We carry all our own leading-edge test equipment such as geophone testers, Sandwich Box vibrator testers, high accuracy timing equipment, digital blaster testers, signal generators and Testf-i in field test analysis software.

Verif-i's in-house consultancy covers diverse disciplines from analysis of tests received via internet to determination whether anomalies seen on seismic data are due to instrumentation or geophysical effects.

Verif-i continues to consult for many energy companies, acquisition contractors and quality control companies worldwide and we have contributed to the success of many projects.
